

Integrating CloudDesk with Slack

Doc ID: HC-101 | Source type: help_center_article | Title: Integrating CloudDesk with Slack | Last updated: 2026-06-18 | Version: v3.6

CloudDesk can post real-time notifications to Slack whenever a ticket is created, updated, or replied to — keeping your team in the loop without needing to check the dashboard.

Step 1: Connect your Slack workspace

Go to Settings → Integrations → Slack → Connect. You'll be redirected to Slack to authorize CloudDesk. Approve the requested scopes (chat:write, channels:read).

Step 2: Choose a default channel

After authorization, select the Slack channel that should receive new-ticket alerts by default. You can add more granular routing rules afterward (see Step 3).

Step 3: Set up routing rules (optional)

Under Settings → Integrations → Slack → Routing Rules, map specific ticket tags or categories to specific channels. For example, route 'Billing' tickets to #billing-support and 'Technical' tickets to #tech-support.

You can also choose which events post to Slack: new ticket, customer reply, ticket resolved, and SLA breach warnings are all available independently.

Troubleshooting

- **Messages stopped posting suddenly:** This is most often an expired OAuth scope after a Slack workspace admin change. Reconnect under Settings → Integrations → Slack and re-select your channel.
- **Integration shows 'disconnected' after enabling SSO:** If the original Slack connection was authorized by a personal user account, enforcing SSO or SCIM provisioning can invalidate that grant. Reconnect using a dedicated service account so the integration doesn't depend on any one person's login.
- **Duplicate notifications for one ticket:** Check Routing Rules for overlapping rules pointing to the same channel — remove the duplicate.
- **Only seeing new tickets, not customer replies:** Add the 'Customer Replied' event to your routing rule; by default only 'New Ticket' is enabled.
