

# Release Notes — v3.6.0

Doc ID: RN-3.6.0 | Source type: release\_notes | Title: Release Notes — v3.6.0 | Release date: 2026-07-30 | Version: v3.6.0

## New features

- Per-domain SSO enforcement: the `enforce_sso` flag can now be set independently for each verified domain in a workspace (PATCH `/v1/sso/domains/{domain_id}`).
- Webhook event replay endpoint: POST `/v1/webhooks/{webhook_id}/events/{event_id}/replay` to resend a single missed event.
- SAML & SCIM Configuration Reference published for administrators integrating Okta, Azure AD, OneLogin, and Google Workspace.

## Improvements

- Slack integration now supports service-account-based connections so the integration no longer breaks when the connecting user's SSO/SCIM status changes.
- Webhook signing secret rotation no longer requires disabling the webhook first.

## Bug fixes

- Fixed the rate limiter keying bug from v3.5.0 that caused false 429s for requests behind shared NATs — now keys strictly on API key.
- Fixed a bug where SCIM deactivation did not consistently revoke sessions within the documented 5-minute window.

## Security

- Improved webhook TLS validation to reject self-signed and expired certificates at delivery time rather than queuing indefinite retries.
